

SHOOT LOG

Operation Manual

Version 2.21.0

Clay shooting records, analysis, ammunition, permits, sync, and backup - explained in one concise guide.

What to know first

- Every change is saved immediately on this device.
- While signed in, records sync to the cloud automatically.
- Save a JSON backup regularly as an independent copy.

Install and sign in

- Add Shoot Log to the Home Screen or Dock from Safari, Chrome, or Edge.
- Sign in with your email address and password.
- Never share authentication links or password-reset links.

Account settings and sync

- Choose Japanese or English under Display language.
- Use Sync now when you need to fetch changes from another device.
- Normal changes are synced automatically.

History and practice focus

- The history screen is the starting point for all major actions.
- Open a card to continue entry or review a completed session.
- Track the current focus and achievement history over time.

Create a session

- Select date, range, discipline, ammunition, and firearm.
- Weather, temperature, and wind are used for condition analysis.
- Set one concrete practice focus for the day.

Prepare a round

- Use the tabs to switch between Rounds 1 to 4.
- Choose the starting stand and single-shot or two-shot mode.
- New rounds begin in two-shot mode.

SCORING

Enter each target

- 1 records a first-shot hit; 2 records a second-shot hit.
- 1+ records a first-shot hit followed by an unnecessary second shot: one point, two shells.
- Miss direction means the target's flight direction. Entry advances automatically.

Review the result

- Review totals, each round, first- and second-shot hits, and miss directions.
- Do not infer an unrecorded cause from the numbers alone.

OPTIONAL AI ANALYSIS

Analyze with your own AI

- The export includes scores, conditions, and your written review.
- Dates, range names, firearm identifiers, and personal identity are excluded.
- Review the copied text and send it yourself.

Pace and stand analysis

- Compare hit rates between the first and second halves.
- Compare hit rate and target-flight miss direction by stand.

REVIEW

Post-session review

- Record what you noticed, what did not work, and what to try next.
- Rate the practice focus as Achieved, Partly achieved, or Not achieved.

Condition and ammunition trends

- Filter by range, ammunition, fire mode, and period.
- Treat small samples as indicative and consider other condition differences.

Manage saved names

- Add or rename shooting ranges and ammunition products.
- Renaming updates past history; deleting an option does not erase history.

Manage ammunition

- Record ammunition received, used, and remaining.
- Completed shooting sessions are added automatically after category mapping.
- The printed Kanagawa ledger remains in the official Japanese format.

Permit and renewal

- Always copy dates from the original permit.
- Manage application start, deadline, and expiry for each firearm.
- Name, address, and date of birth are not stored.

BACKUP

Backup and restore

- Export all device data to one JSON file.
- Restore merges with current data instead of deleting it.
- Save a fresh backup before major data operations.

If something goes wrong

- Check the connection and signed-in account if data is not synced.
- Use the update notice or safe recovery if the screen is outdated.
- Never include passwords or firearm permit numbers in support email.

Major versions

- 2.21.0 - Japanese and English interface, including records, analysis, account, permits, ammunition, backup, support, and legal documents.
- 2.20.0 - Added 1+ for a second shot fired after a first-shot hit.
- 2.0.0 - Added Supabase accounts and cloud sync.
- 1.0.0 - Integrated PWA, PDF output, ammunition, and permit deadlines.
